

Chapter 6

P18

$$t_1 = 512 + 64 = 576$$

At $t=0$ A starts transmit.

$$\text{time delay} = 325$$

At t_1 , A will finish. The worse case

$$325 - 1 = 324$$

B begins transmitting at $t = 324$

$$t_2 = 324 + 325 = 649$$

which is the first bit of A arrives
so at the t_2 B first bit arrive

A, $\because t_2 > t_1$ so A finishes
transmitting before that B has transmitted
so A incorrectly thinks that its frame
was successfully transmitted without
collision
